# Certain expansion formulae involving a basic analogue of I-function 

*Farooq Ahmad ${ }^{1}$, D.K. Jain ${ }^{2}$ Alok Jain ${ }^{3}$<br>${ }^{1}$ Department of Mathematics, Govt. Degree College, Kupwara, J\&K-India.<br>${ }^{2}$ Department of Mathematics Madhav Institute of technology and science, Gwalior-India<br>${ }^{3}$ Department of Mathematics, Amity University, Gwalior-India

#### Abstract

In the present paper, the authors explain certain expansion of the basic analogue of the I-function in relationship with the applications ofq-Leibnitz rule for the Weyl type q-derivatives of a product of two functions. Expansion formulae involving a basic analogue of H-function, Meijer's G-function and MacRobert's E-function have been derived as special cases of the results.

Keywords: q-Leibnitz rule; Weyl functions; q-operator; Basic analogue of the I-function.AMS 2000 Subject Classification Numbers:33D60 and 26A33

## Introduction and Mathematical Preliminaries

Our translation of real world problems to mathematical expressions relies on calculus, which in turn relies on the differentiation and integration operations of arbitrary order with a sort of misnomer fractional calculus which is also a natural generalization of calculus and its mathematical history is equally long. It plays a significant role in number of fields such as physics, rheology, quantitative biology, electro-chemistry, scattering theory, diffusion, transport theory, probability, elasticity, control theory, engineering mathematics and many others. Fractional calculus like many other mathematical disciplines and ideas has its origin in the quest of researchers for to expand its applications to new fields. This freedom of order opens new dimensions and many problems of applied sciences can be tackled in more efficient way by means of fractional calculus.

The purpose of this paper is to increase the accessibility of different dimensions of q -fractional calculus and generalization of basic hyper-geometric functions to the real world problems of engineering, science and economics. Present paper reveals a brief history, definition and applications of basic hyper-geometric functions and their generalizations in light of different mathematical disciplines. The paper is devoted to derive certain expansion formulae for a basic analogue of Ifunction defined by [1] in terms of Gamma function as follows:

## JK Research Journal in Mathematics and Computer Sciences

$I_{q, 4, k, i}^{m, n}\left[z ; q \mid\left(a_{j}, \alpha_{j}\right)_{1, n}\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}\right]=\frac{1}{\left.2 \pi w_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}} \frac{\prod_{j=1}^{m} \Gamma_{q}\left(b_{j}-\beta_{j} s\right) \prod_{j=1}^{n} \Gamma_{q}\left(1-a_{j}+\alpha_{j} s\right)}{\sum_{i=1}^{R}\left\{\prod_{j=m+1}^{B R_{i}} \Gamma_{q}\left(1-b_{j i}+\beta_{j i} s\right) \prod_{j=n+1}^{A} \Gamma_{q}\left(a_{j i}-\alpha_{j i} s\right)\right\} \Gamma_{q}(s) \Gamma_{q}(1-s) \sin \pi s} \pi z^{s} d s$
Saxena et.al.[2] also defined in terms of Mellin-Barne's integral as follows:

$$
I_{A_{i}, B_{i} ; R}^{m, n}\left[z ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)_{1, n}\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}  \tag{2}\\
\left(b_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}
\end{array}\right.\right]=\frac{1}{2 \pi \omega} \int_{L} \frac{\prod_{j=1}^{m} G\left(q^{b_{j}-\beta_{j} s}\right) \prod_{j=1}^{n} G\left(q^{1-a_{j}+\alpha_{j} s}\right) \pi z^{s} d s}{\sum_{i=1}^{R}\left\{\prod_{j=m+1}^{B_{i}} G\left(q^{1-b_{j i}+\beta_{j i} s}\right) \prod_{j=n+1}^{A_{i}} G\left(q^{a_{j i}-\alpha_{j i s} s}\right)\right\} G\left(q^{1-s}\right) \sin \pi s}
$$

Where $\mathrm{z} \neq 0,0<|q|<1, \omega=\sqrt{-1}$ and
$0 \leq m \leq B_{i}, 0 \leq n \leq A_{i}, i=1,2,3, \ldots, R ;$ Risfinite ${ }_{j}$ and
$G\left(q^{\alpha}\right)=\prod_{m=0}^{\infty}\left\{\left(1-q^{\alpha+n}\right)\right\}^{-1}=\frac{1}{\left(q^{\alpha} ; q\right)_{\infty}}$
Also, $\alpha_{j i} \beta_{j i}, \alpha_{j i}, \beta_{j i}$ are real and positive and $a_{j}, b_{j}, a_{j i}, b_{j i}$ are complex numbers.
The contour of integration $L$ runs from -isoto $+t i \infty$ in such a manner that all the poles of $G\left(q^{b_{j}-\beta_{j} s}\right)$ $; 1 \leq j \leq m$, are to the right and those of $G\left(q^{1-a_{j}+\alpha_{j} s}\right) ; 1 \leq j \leq n a r e ~ t o ~ i t s ~ l e f t ~ a n d ~ a r e ~ a t ~ l e a s t ~ s o m e ~$ $\varepsilon>0$ distanceaway from the contour $L$. The integral converges if $\operatorname{Re}[\operatorname{slog}(z)-\log \sin \pi s]<0$, for large values of $|s|$ son the contour that is if $|\operatorname{argz}|<\pi$.

The q - analogues of H - function is terms of the Mellin - Barne's type basic contour integral is given by

$$
[7
$$

8] as
 where $G\left(q^{\alpha}\right)=\left(\prod_{n=0}^{\infty}\left(1-q^{\alpha+n}\right)\right)^{-1}=\frac{1}{\left(q^{\alpha} q\right)_{\infty}}$
and $0 \leq \mathrm{m} \leq \mathrm{B}, 0 \leq \mathrm{n} \leq \mathrm{A} ; \alpha_{\mathrm{j}}$ and $\beta_{\mathrm{j}}$ are all positive integers, and $\mathrm{a}_{\mathrm{j}}$, $\mathrm{b}_{\mathrm{j}}$ are complex numbers, where L is contour of integration running from $-\mathrm{i} \infty$ to ios in such a manner so that all poles of $G\left(q^{b_{j}-\beta_{j} \bar{s}}\right)$ lie to right of the path and $G\left(q^{1-a_{j}+u_{j} \varepsilon}\right)$ are to the left of the path.

The integral converges if $\operatorname{Re}[s \log (z)-\log \sin \pi s\}<0$, for large values of $|\mathrm{s}|$ on the contour L , that is if $\left|\left\{\arg (z)-w_{2} w_{1}^{-1} \log |z|\right\}\right|<\pi$, where $|q|<1, \log q=-w=-\left(w_{1}+i w_{2}\right)$.

## JK Research Journal in Mathematics and Computer Sciences

The above definition can be used to define the q -analogues of Meijer's G-function as follows:

$$
\begin{aligned}
& H_{A, B}^{m, n}\left[z ; q\left[\begin{array}{l}
(a, 1)_{1, p} \\
(b, 1)_{1, q}
\end{array}\right]=G{ }_{A, B}^{m, n}\left[\begin{array}{l}
z_{j} q
\end{array} \left\lvert\, \begin{array}{c}
a_{1}, a_{2}, \ldots, a_{p} \\
b_{1}, b_{2}, \ldots, b_{q}
\end{array}\right.\right]\right. \\
& \quad=\frac{1}{2 \pi i} \int_{i} \frac{\prod_{j=1}^{m} G\left(q^{b_{j}-s}\right) \prod_{j=1}^{n} G\left(q^{1-a_{j}+s}\right) \pi s^{s} d s}{\prod_{j=m+1}^{q} G\left(q^{1-b_{j}+s}\right) \prod_{j=n+1}^{p} G\left(q^{a_{j}-s}\right) G\left(q^{1-s}\right) \sin \pi s}
\end{aligned}
$$

Riemann-Liouville fractional integrals: As defined in [3, 4], the Riemann-Liouville fractional integral is given by:
$\left(I_{a+}^{\alpha} \mathrm{f}\right) x=\frac{1}{r(\alpha)} \int_{a}^{x}(x-t)^{\alpha-1} f(\mathrm{t}) \mathrm{dt},\left(x>a_{r} a \in R\right)$. (3) Thus, in general the Riemann-Liouville fractional integrals of arbitrary order for a function $f(t)$, is a natural consequence of the well-known formula (Cauchy-Dirichlets?) that reduces the calculation of the $n$-fold primitive of a function $f(t)$ to a single integral of convolution type.

Recently, Yadav et. al. [5] introduces a new q-extension of the Leibnitz rule for the derivatives of a product of two basic functions in terms of a finite $q$-series involving Weyl type q-derivatives of the functions in the following manner.

$$
D_{z, \alpha, q}^{\alpha}[U(v) V(z)]=\sum_{r=0}^{\infty} \frac{(-1)^{r} q^{(r(t) 1)}\left(q^{-\alpha} ; q\right)_{r}}{(q ; q)_{r}} D_{z \alpha, q}^{\alpha-r}[U(z)]{ }_{z}^{\alpha}\left[\begin{array}{c}
\alpha, q \tag{4}
\end{array}\right]
$$

 Weyl type is given by

$$
\begin{equation*}
{\underset{z,}{ }}_{D_{\infty, q}}^{\alpha}[f(z)]=\frac{q^{\frac{-\alpha(\alpha+1)}{2}}}{\Gamma_{q}(-\alpha)} \int_{z}^{\infty}(t-z)_{-q-1} f\left(t q^{1+\alpha}\right) d_{q}(t) \tag{5}
\end{equation*}
$$

In particular for $f(z)=z^{-p}$ the equation becomes:

$$
\begin{equation*}
{\underset{z}{2}}_{\infty}^{\alpha}\left[z^{-p}\right]=\frac{\Gamma_{q}(p+\alpha) q^{-\alpha p+\frac{\alpha(1-\alpha)}{2}} z^{-p-\alpha}(1-q)}{\Gamma_{q}(p)} \tag{6}
\end{equation*}
$$

## Main Results

In this section, we shall establish certain results associated with basic analogue of I-function by assigning suitable values to the functions $z$, and $\alpha$ in the $q$-Leibnitz rule. The main results to be established are as follows:

## JK Research Journal in Mathematics and Computer Sciences

$$
\begin{align*}
& I_{A_{i}+1, B_{i}+1 ; R}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)_{1, n}\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}(\lambda, k) \\
(\mu+\lambda, k)\left(b_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}
\end{array}\right.\right]=\sum_{r=0}^{\mu} \frac{(-1)^{r} q^{\frac{r(r+1)}{2}+\lambda r}\left(q^{-\mu} ; q\right)_{r}\left(q^{\lambda} ; q\right)_{\mu-r}}{(q ; q)_{r}} \\
& \times I_{A_{i}+1, B_{i}+1 ; R}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)_{1, n},\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}(0, k) \\
(r, k)\left(b_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}
\end{array}\right.\right] \tag{7}
\end{align*}
$$

Where $0 \leq m \leq B, 0 \leq n \leq A, \operatorname{Re}[\operatorname{slog}(z)-\log \sin \pi s]<0, k \geq 0, P \in C$.
Proof. To prove the result, we put
$U(z)=z^{-\lambda}$ and $V(z)=I_{A_{i}, B_{i} ; R}^{m, n}\left[P z^{k} ; q \left\lvert\, \begin{array}{l}\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\ \left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)\end{array}\right.\right]$
in the equation (4) and therefore, we have

$$
\begin{align*}
& {\underset{z, \infty}{ }}_{D_{z, q}}\left\{z^{-\lambda} I_{A_{i}, B_{i} ; R}^{m, n}\left[P z^{k} ; q \left\lvert\, \begin{array}{c}
\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\
\left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)
\end{array}\right.\right]\right\}=\sum_{r=0}^{\mu} \frac{(-1)^{r} q^{\frac{r(r+1)}{2}}\left(q^{-\mu} ; q\right)_{r}}{(q ; q)_{r}}{\underset{z, \infty, q}{\mu-r}}_{D^{\mu}}\left\{z^{-\lambda}\right\}  \tag{8}\\
& \times{\underset{z, ~}{\infty}, q}_{\alpha}\left\{I_{A_{i}, B_{i} ; R}^{m, n}\left[P\left(z q^{\mu-r}\right)^{k} ; q \left\lvert\, \begin{array}{c}
\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\
\left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)
\end{array}\right.\right]\right\} \tag{9}
\end{align*}
$$

Now, in view of (1), the L.H.S. of (9) reduces to

$$
\begin{align*}
& \stackrel{\mu}{\underset{z, \infty, q}{\mu}\left\{z^{-\lambda} I_{A_{i}, B_{i} ; R}^{m, n}\left[P z^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\
\left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)
\end{array}\right.\right]\right\}=} \\
& \quad \frac{1}{2 \pi i} \int_{L} \frac{\prod_{j=1}^{m} \Gamma_{q}\left(b_{j}-\beta_{j} s\right) \prod_{j=1}^{n} \Gamma_{q}\left(1-a_{j}+\alpha_{j} s\right) \pi P^{s}}{\sum_{i=1}^{R}\left\{\prod_{j=m+1}^{B_{i}} \Gamma_{q}\left(1-b_{j i}+\beta_{j i} s\right) \prod_{j=n+1}^{A_{i}} \Gamma_{q}\left(a_{j i}-\alpha_{j i} s\right)\right\} \Gamma_{q}(s) \Gamma_{q}\left(q^{1-s}\right) \sin \pi s}{\underset{z, \infty, q}{\mu}\left\{z^{-(\lambda-k s)}\right\} d s}^{\mu} \tag{10}
\end{align*}
$$

On making use of fractional q-derivative formula in the above equation, we obtain following interesting transformations for the $\mathrm{I}_{\mathrm{q}}($.$) function after certain simplifications.$

$$
\begin{align*}
\stackrel{\mu}{\underset{z, \infty, q}{ }\left\{z^{-\lambda} I_{A_{i}, B_{i} ; R}^{m, n}\left[P z^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\
\left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)
\end{array}\right.\right]\right\}} \begin{aligned}
(1-q)^{\mu} & =\frac{z^{-\lambda-\mu} q^{\mu \lambda+\mu(1-\mu) / 2}}{(1-2} \\
& \times I_{A_{i}+1, B_{i}+1 ; R}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)_{1, n},\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}(\lambda, k) \\
(\mu+\lambda, k)\left(b_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}
\end{array}\right.\right]
\end{aligned}
\end{align*}
$$

Now taking $\lambda=0$ and replacing $\mu$ byr and then $z b y z q^{\mu-r}$ respectively in(11) to get the result

## JK Research Journal in Mathematics and Computer Sciences

$$
\begin{align*}
\underset{z, \infty, q}{\underset{\sim}{\infty}\left\{z^{-\lambda} I_{A_{i}, B_{i} ; R}^{m, n}\left[P\left(z q^{\mu-r}\right)^{k} ; q \left\lvert\, \begin{array}{c}
\left(a_{j}, \alpha_{j}\right)\left(a_{j i}, \alpha_{j i}\right) \\
\left(b_{j}, \beta_{j}\right)\left(b_{j i}, \beta_{j i}\right)
\end{array}\right.\right]\right\}} \begin{aligned}
& =\frac{z^{-r} q^{\frac{r(r+1)}{2}-r \mu}}{(1-q)^{r}}
\end{aligned} \\
\times I_{A_{i}+1, B_{i}+1, R}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
\left(a_{j}, \alpha_{j}\right)_{1, n},\left(a_{j i}, \alpha_{j i}\right)_{n+1, A_{i}}(0, k) \\
(r, k)\left(b_{j}, \beta_{j}\right)_{1, m}\left(b_{j i}, \beta_{j i}\right)_{m+1, B_{i}}
\end{array}\right.\right] \tag{12}
\end{align*}
$$

In view of (6), we can easily get the following result

On substituting the values of the expressions involved in (9), from (11), (12) and (13) we arrive at the right hand side of the given theorem (7).

## Special cases

In this section, we shall consider some special cases of the main result and deduce certain expansion formulae for basic analogue of $\mathrm{H}, \mathrm{G}$ and E - functions as follows:
(i) It is interesting to observe that for taking $R=1, A_{i}=A, B_{i}=B$, we get well known result of Saxena et.al. [6]

$$
H_{A+1, B+1}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
(a, \alpha)(\lambda, k)  \tag{14}\\
(\mu+\lambda, k)(b, \beta)
\end{array}\right.\right]=\sum_{r=0}^{\mu} \frac{(-1)^{r} q^{\frac{r(r+1)}{2}+\lambda r}\left(q^{-\mu} ; q\right)_{r}\left(q^{\lambda} ; q\right)_{\mu-r}}{(q ; q)_{r}} \times H_{A+1, B+1}^{m+1, n}\left[P\left(z q^{\mu}\right)^{k} ; q \left\lvert\, \begin{array}{l}
(a, \alpha)(0, k) \\
(r, k)(b, \beta)
\end{array}\right.\right]
$$

(ii) If we set $\alpha=\beta=1$, and $k=1$, in equation (14), we get the following interesting expansion formula for $q$-analogue of Meijer's G-function as,

$$
G_{A+1, B+1}^{m+1, n}\left[P z q^{\mu} ; q \left\lvert\, \begin{array}{l}
a_{1}, a_{2}, \ldots, a_{p}, \lambda  \tag{15}\\
\mu+\lambda, b_{1}, b_{2}, \ldots, b_{q}
\end{array}\right.\right]=\sum_{r=0}^{\mu} \frac{(-1)^{r} q^{\frac{r(r+1)}{2}+\lambda r}\left(q^{-\mu} ; q\right)_{r}\left(q^{\lambda} ; q\right)_{\mu-r}}{(q ; q)_{r}} \times G_{A+1, B+1}^{m+1, n}\left[P z q^{\mu} ; q \left\lvert\, \begin{array}{l}
a_{1}, a_{2}, \ldots, a_{A}, 0 \\
r, b_{1}, b_{2}, \ldots, b_{B}
\end{array}\right.\right]
$$

(iii) Finally if we set $\mathrm{n}=0$, and $\mathrm{m}=\mathrm{B}$, the result obtained is of q -analogue of MacRobert'sEfunction as,

## JK Research Journal in Mathematics and Computer Sciences

$$
\begin{equation*}
E_{q}\left[B+1 ; b_{j}, \mu+\lambda, A+1, A_{j}, \lambda P z q^{\mu}\right]=\sum_{r=0}^{\mu} \frac{(-1)^{r} q^{\frac{r(r+1)}{2}+\lambda r}\left(q^{-\mu} ; q\right)_{r}\left(q^{\lambda} ; q\right)_{\mu-r}}{(q ; q)_{r}} \times E_{q}\left[B+1 ; b_{j}, r, A+1, a_{j}, 0, P z q^{\mu}\right] \tag{16}
\end{equation*}
$$

## Conclusion

In this paper, we have explored the possibility for derivation of some expansions of basic analogue I- function. The results thus derived are general in character and likely to find certain applications in the theory of hyper-geometric functions. Finally we conclude with the remark that the results and the operators proved in this paper appear to be new and likely to have useful applications to a wide range of problems of mathematics, statistics and physical sciences.
